Alternative version. Partly automated by Tobias Nipkow. Takes 2 minutes (2002).

This is the maximal amount of automation possible using *blast*.

theorem *newman'*:
assumes *wf*: *wfP* (R^{-1-1})

$\exists d.\ R^{**}\ b\ d \wedge R^{**}\ c\ d$

Using the coherent logic prover, the proof of the induction step is completely automatic.

The following functions convert between Isabelle's built-in `term` datatype and the generated `dB` datatype. This allows to generate example terms using Isabelle's parser and inspect normalized terms using Isabelle's pretty printer.
